

### Pascal triangles:

nth row:  $nC_0 + nC_1 + nC_2 + \dots + nC_n$

### Check sign of the integer(a\*b):

```
int sign=(A<0)^(B<0)?(-1):1;
```

### Check data type of variable:

```
Include <typeinfo>
```

```
Int k;
```

```
Cout<<typeid(k).name() <<endl;
```

OR

### Making list:

```
list<int> m1 = { 10, 20, 30 };
```

min(), max(), takes only two arguments.

If there is a number a that divides number n there always exist another number n/a that is a factor of n

Convert Character into integer: `char c=A[i], ==> c - '0'` will give integer

For making number always positive:

`abs()` for **int**

`fabs()` for **double**

`fabsf()` for **float**

Running code: `cntrl+f5`

Printing output in a same line: `cout<< arr[i]<<"\t";`

### For division (dividing 2 numbers) :

**Integer division:** In the expression `1 / 6`, both numbers are integers. This means that this division will perform integer division, which results in 0.

**Float division:**

To do a double division, one number has to be a double: `1.0 / 6` OR `(float)n / (float)m`

- **Remainder:** `( a % b )`
- **For all type of pattern questions:**
  - See the relation b/w row and number given
  - Then see the pattern row wise and use loop step wise like 1st loop for how many space, then 2nd loop for number/ pattern.
- To remove the last digit from a number: **`N/10`** and to get last digit: **`N%10`**

- To print **float** and **double** up to specific number of decimal places use:

- `#include <iomanip>`
- `Double e;`
- `Float d;`
- `cout << fixed << setprecision(3) << d << endl;`
- `cout << fixed << setprecision(9) << e << endl;`

OR

```
std::cout << std::fixed << std::setprecision(3) << d << endl;
```

```
std::cout << std::fixed << std::setprecision(9) << e << endl;
```

- To check if true or not:  
Isprime: we can do it by taking Boolean function

- **switch..case Statement: Syntax**

```
switch (expression) {
case constant1:

// code to be executed if
// expression is equal to constant1;

break;

case constant2:

// code to be executed if
// expression is equal to constant2;

break;

.

.

.

default:

// code to be executed if
// expression doesn't match any constant

}
```

## SUMMARY

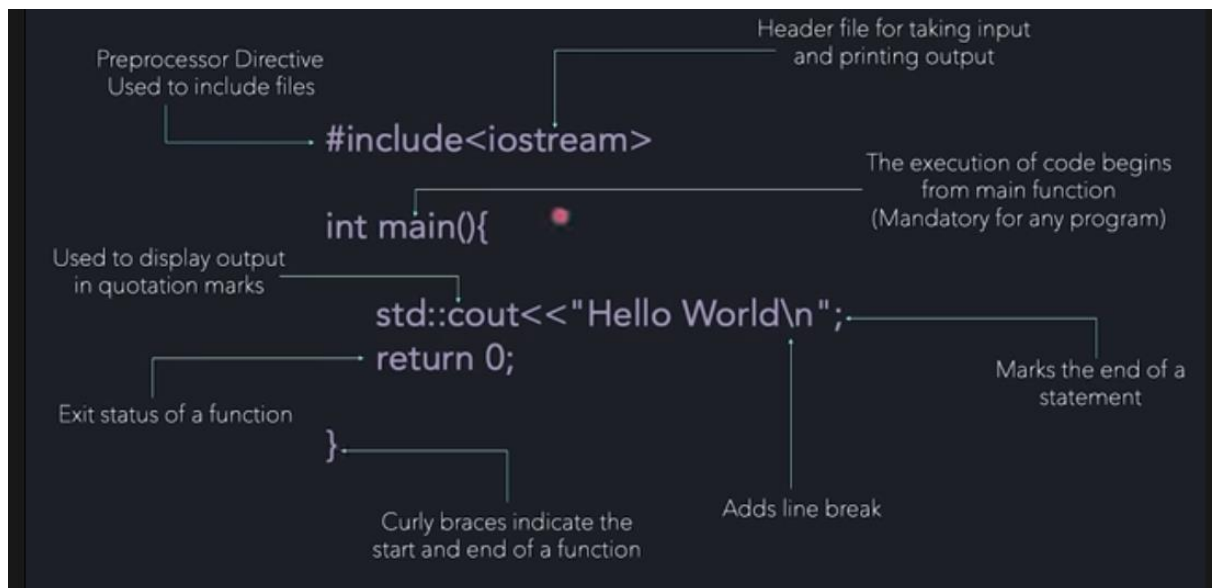

- Counting (Natural) numbers:  $1, 2, 3, 4, 5, 6, 7, \dots$
- Whole numbers:  $0, 1, 2, 3, 4, 5, 6, 7, \dots$
- Integers:  $\dots, -5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, \dots$
- Rational numbers:  $-5, -4, -\frac{13}{4}, -2, -1, 0, \frac{1}{8}, 1, \frac{2}{3}, 2, \frac{7}{3}, 5$
- Irrational numbers:  $\pi, \sqrt{2}, \sqrt{3}, \sqrt{5}, \sqrt{7}$
- Real numbers:  $-5, -4, -\frac{13}{4}, -2, -1, 0, \frac{1}{8}, 1, \frac{2}{3}, 2, \frac{7}{3}, 5, \pi, \sqrt{3}, \sqrt{5}, \sqrt{7}$

### DATA TYPES:

1. Int-4bytes
2. Float-4bytes
3. Double-8bytes
4. Char-1byte
5. Wchar\_t ( wide char )-2bytes
6. Bool-1byte

```
#include<iostream>  
Using namespace std;
```

#Condition? X:Y

## 6. Miscellaneous Operators

<code>sizeof()</code>	Returns the size of variable	<code>int a;</code> <code>sizeof(a) → 4</code>
<code>Condition? X:Y</code>	Returns value of X if condition is true or else value of Y	
<code>Cast</code>	Convert one data type to another	<code>int a = 10</code> <code>int b = 5</code>
<code>Comma(,)</code>	Causes a sequence of operations to be performed	<code>int c = (a &gt; b) ? a - b : b - a</code>
<code>&amp;</code>	Returns the address of a variable	
<code>*</code>	Pointer to a variable	

Ternary/  
Conditional  
Operator
